The Form app

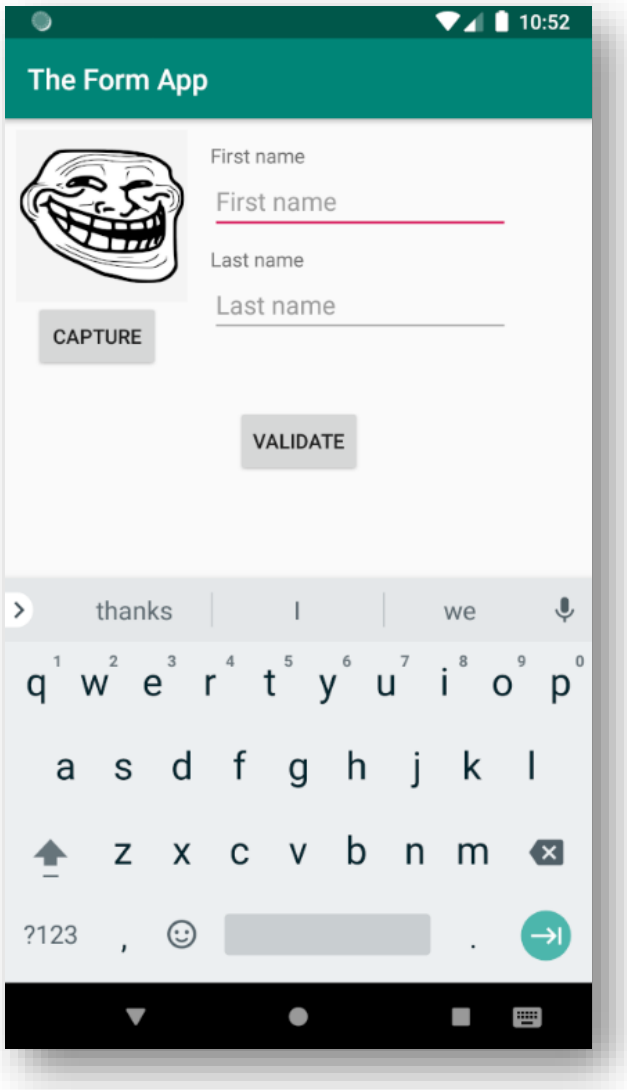

Create an app called *The Form app*. It is a simple application with two screens.

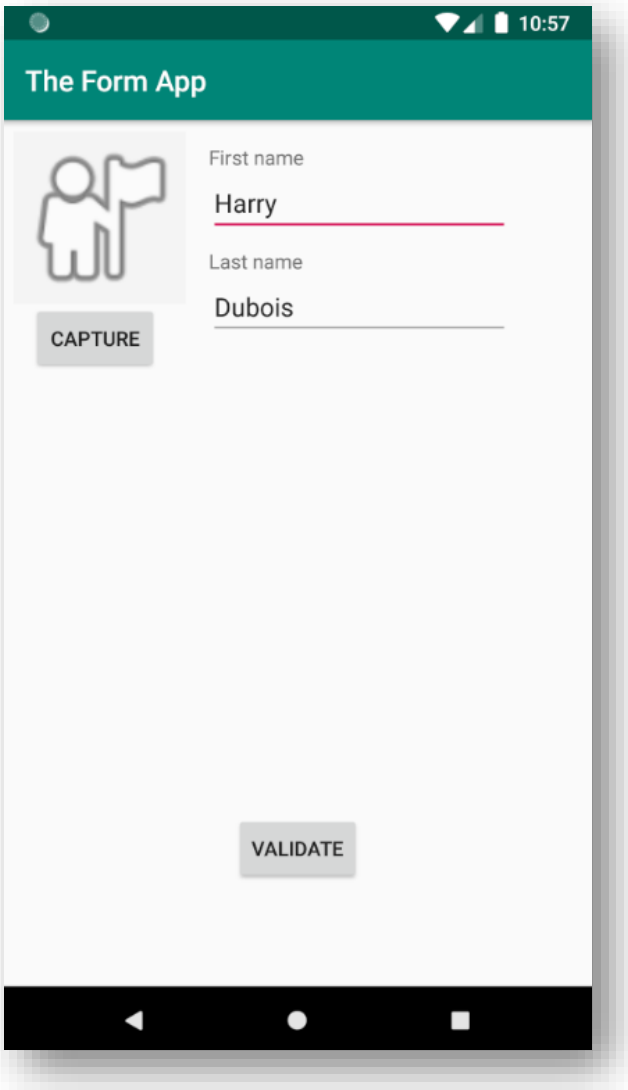

The first screen is a list of persons (basic thumbnail, first name and last name) with a button to add a person in the list.

Picture for illustration purposes only

When you click on the “Plus”, or “Add” button, you reach the Form screen. It is empty and ready to be filled to create a new sheet in the list. When you click on a person or on the button, you also reach the Form screen. But this time, it is filled with the data for the selected person.

In the Form screen, you can input and /or modify the data for the person : first name, last name, and picture. To get a picture, use the camera.

Validate with the dedicated button to return to the list.

Capture picture

To capture a picture using the camera you can use the (obsolete but simple) raw *startActivityForResult()* -> *onActivityResult()* method with Intent action code `MediaStore.ACTION_IMAGE_CAPTURE`, in which case the thumbnail can be extracted from result Intent *data*

```
val imageBitmap = data?.extras?.get("data") as Bitmap
```

Do not forget to require camera permission in your manifest file.

```
<manifest xmlns:android="http://schemas.android.com/apk/res/android"
    xmlns:tools="http://schemas.android.com/tools">

    <!-- Do not forget to manually allow this permission after first launch -->
    <uses-feature android:name="android.hardware.camera"/>
    <uses-permission android:name="android.permission.CAMERA"/>
```

The full method to require permission properly can be heavy to integrate. So to allow this permission, run the app requiring the permission, then allow it in your phone/emulator settings.
